Small Grain Variety Recommendations for 2004

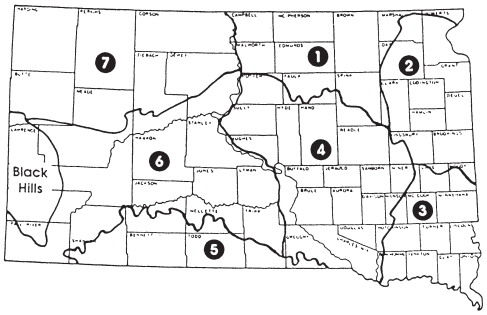
Recommendations are based on data obtained from the South Dakota State University Crop Performance Testing (CPT) Program and regional land-grant university nurseries. Variety performance depends on genetics and the environment. Environmental factors like temperature, moisture, plant pests, soil fertility, soil type, and management practices affect variety performance. Note the performance of recommended varieties in response to environmental conditions is generally better than the performance of other varieties. The better performance of a recommended variety, however, cannot always be guaranteed due to its complex response to the environment. Variety recommendations including the crop adaptation area (CAA) where they are most suited are listed below:

SPRING WHEAT

Recommended:		**Acceptable/Promising:**	
Variety	*CAA*	*Variety*	*CAA*
Briggs @	Statewide	Alsen @	1, 2, 7
Forge @	Statewide	Norpro @	1, 2, 7
Ingot @	Statewide	Parshall @	1, 7
Knudson @	Statewide	Walworth @	Statewide
Oxen @	Statewide		
Reeder @	Statewide		
Russ @	Statewide		

Crop Adaptation Areas for South Dakota

(revised 1992)



OATS

Recommended:		**Acceptable/Promising:**	
Variety	*CAA*	*Variety*	*CAA*
Don	1, 4, 5, 6, 7	Buff (hull-less)	Statewide
Jerry #	Statewide		
Loyal +	1, 2, 4, 6, 7		
Reeves	Statewide		

BARLEY

Recommended:		**Acceptable/Promising:**	
Variety	*CAA*	*Variety*	*CAA*
Excel @	1, 2, 4, 6, 7	Conlon @	1, 4, 6, 7
Lacey @	Statewide	Drummond @	Statewide
Robust @	1, 2, 4, 6, 7		

American Malting Barley Association approved malting varieties for South Dakota - 2003.

Conlon	*Lacey*
Drummond	*Legacy*
Excel	*Morex*
Foster	*Robust*

WINTER WHEAT revised

Recommended:		**Acceptable/Promising:**	
Variety	*CAA*	*Variety*	*CAA*
Alliance @	3, 4*, 5, 6	Crimson @	1*, 2*, 3*, 4*, 6, 7
Arapahoe @	1*, 3, 4*, 5, 6, 7*	Expedition @	1*, 4, 5, 6, 7*
Harding @	1*, 2*, 4, 7	Jagalene @	1*, 3, 4*, 5, 6, 7*
Millennium @	1*, 4*, 5, 6, 7	Trego (white) @	5, 6, 7*
Tandem @	1*, 3, 4*, 5, 6, 7*		
Wesley	1*, 3, 4*, 5, 6, 7*

Small Grains

2003 South Dakota Test Results: Variety Traits and Yield Averages

Robert G. Hall, Extension agronomist—crops
John Rickertsen, research associate
Kevin K. Kirby, agricultural research manager

Variety selection is a fundamental element in a sound crop production program. This report contains variety recommendations, descriptions, and yield data for the spring-seeded small grains—hard red spring wheat, oat, and barley—and the fall-seeded small grain, hard red winter wheat.

Key factors in variety selection include yield, yield stability, maturity, straw strength, height, test weight, quality, and disease resistance. Yield is important; however, a variety with good disease resistance, straw strength, and high grain quality may be more profitable in some cases than the highest yielding variety.

Disease resistance information is based on reactions to prevalent races of a disease. Disease resistance is not constant, and new races may develop over time.

Variety recommendations (inside cover)

The Plant Science Department Variety Recommendation Committee makes small grain variety recommendations annually. Recommendations for a given crop may vary from one crop adaptation area (CAA) to another.

Crop adaptation areas (see map) are based on soil type, elevation, temperature, and rainfall. Varieties are recommended on the basis of growing season, average rainfall, disease frequency, and farming practices common to a crop adaptation area. Varieties are listed as "Recommended" or "Acceptable/Promising."

Varieties exhibiting a high level of agronomic performance are listed as "Recommended." Each test entry must meet the minimum criteria listed in Table A before it is eligible for the "Recommended" list. Varieties listed as "Acceptable/Promising" have performed well, but do not merit the "Recommended" list or are new varieties with a high performance potential but that do not meet the 3-year criteria (Table A) needed to make the "Recommended" list. A variety needs 2 years and 6 location-years in the SDSU crop performance test trials and/or regional nurseries before it is eligible for the "Acceptable/Promising" list.

Certified seed is the best source of seed and the only way farmers can be assured of the genetic purity of the variety purchased.

How to use this information

Use this report to select small grain varieties for South Dakota.

1. Check the variety-crop adaptation area (CAA) designations for the "Recommended" and "Acceptable/ Promising" lists. Compare these variety-CAA designations with the CAA map of South Dakota. **Identify the varieties suggested for your CAA.**

2. **Evaluate the varieties you selected for desirable traits.** Descriptive information (the traits table) is updated as changes occur. This information is obtained from the SDSU Crop Performance Testing Program and from research plots maintained by plant breeders and plant pathologists. Straw strength, protein, height, and test weight are based on statewide averages. Disease resistance continually changes; therefore, new information is reported as it becomes available. To evaluate maturity compare the relative maturity (heading) rating of each variety to the reference or check variety given.

   The Fusarium head blight tolerance rating for hard red spring wheat is also given. Note that the head

blight ratings show **there is presently no variety resistance to this disease**. It does, however, indicate **some varieties are more tolerant** of the disease than others. In addition, stripe rust became a major concern in 2003. Note the stripe rust reactions of the various varieties in the traits table.

3. **Evaluate each variety you select for yield performance**. Yields are obtained from the SDSU Crop Performance Testing Program. Both 1- and 3-year average yields for each variety tested are included for each test location if the variety was tested for 3 or more years. Yield values for each variety and location average and for each location least-significant-difference (LSD) value are rounded to the nearest bushel per acre.

Location averages, LSD values, and coefficients of variation (CV) values listed below each location yield column are calculated using all entries in each test. This includes both released varieties and experimental lines. Only data for released varieties are reported; therefore, the test average for a location yield column may not equal the average for the individual yields you observe in the table. Likewise, the test LSD values obtained from the location data are also based on both varieties and experimental lines. Varieties and experimental lines are included in the test results for you to see how known varieties compare to experimental lines that may be released in the near future.

Always compare yields from the same period of time. Compare 1-year yields with other 1-year yields, and 3-year yields with other 3-year yields. Do not compare a 1-year average with a 3-year average.

Before evaluating any data at a location, determine whether the data are valid. The CV value at the bottom of each yield column is a measure of experimental error. Yield tests with a CV of 16% or higher contain higher amounts of experimental error than tests with a CV of 10% or less. **Test sites with a CV greater than 15% are not included in the calculations for yield stability. At these sites, the top yielding varieties are not indicated in the table because the validity of the yield differences among the varieties is uncertain as a result of the high level of experimental error**.

The LSD value indicates whether one variety really out yields another. If a yield difference between two varieties is greater than the LSD value, the varieties differ in yield. If the yield difference is equal to or less than the LSD value, the varieties do not statistically differ in yield.

The LSD value may also be used to determine the top yield group for each location. For example, at each location the variety with the highest numerical yield is identified using 1- or 3-year averages. The reported test LSD value is subtracted from the highest yielding variety. Varieties with yields greater than this value (highest yield minus test LSD) are in the top yield group at that location.

For example, the top yielding entry at Brookings for 2003 was an experimental line (not reported) that yielded 67 bu/acre. Subtracting 6 bu/acre (the rounded-off LSD value) from the highest yield entry of 67 bu/acre equals 61 bu/acre. Therefore, all varieties listed in that column yielding 62 bushels or higher are in the top yield group that included Forge, Russ, and Walworth, and one experimental line not reported. Any variety yielding 61 bushels or less is not in the top yield group.

For convenience, varieties in the top yield group at each location have been determined by computer and are listed, with a **plus (+) sign**, in the yield columns of each yield table. Yields are rounded off and reported to the nearest bushel per acre. At some locations, a plus (+) may be absent for all values within a yield column. This indicates the top yielding entries were experimental lines; therefore, no plus signs are indicated because none of the released varieties under test were in the top yield-group.

Sometimes a LSD value is not given and the designation $$ is listed. This indicates yield differences were not significant (NS) or yield differences could not be detected. Therefore, all the varieties have a similar yielding potential and are considered to be in the top yield group. In some cases a high level of experimental error is indicated by a high CV value. In such a case the top yield group is not determined.

When evaluating yield performance, remember that environmental conditions at a test location seldom repeat themselves from year to year. Look at yield data from as many trial locations and years as possible.

Look at the performance or "yield stability" of a variety over several locations. A simple way of evaluating "yield stability" is to see how often a variety is in the

top-yield group over all test locations. For convenience, the top-yield percentage or the percentage of locations where a variety is in the top-yield group has been calculated. **The top yield percentage for each variety is given in the agronomic performance average table for each of the spring-seeded small grains.**

A variety exhibiting a relatively high top yield percentage will appear in the top yield group at many locations, but not necessarily at all locations. For example, a variety with a top yield percentage of 50% or more exhibits good yield stability. In contrast, a variety with a top yield percentage of 30% or less exhibits low yield stability.

Varieties with a high top yield percentage have the ability to adapt to a wide range of environmental conditions across many locations. In contrast, varieties with a low top yield percentage typically adapt to a narrow range of environments. **Look for varieties with a relatively high top-yield percentage of 50% or higher if possible.**

Origin of varieties tested

Public varieties were released from state Agricultural Experiment Stations. Abbreviations for each include:

Colorado--CO	Illinois--IL
Kansas--KS	Minnesota--MN
Nebraska--NE	North Dakota--ND
South Dakota--SD	Texas--TX
Wisconsin--WI	

Many public varieties were developed and released jointly by one or more experiment stations or USDA. Proprietary varieties were released by commercial companies. Company abbreviations for these include:

Agri Pro Wheat, Inc.—AP General Mills—GM
Busch Agricultural Resources, Inc.- BARI

Trial methods

A random complete block design was used in all trials. Plots were harvested with a small plot combine. Plot size differed between the East River and West River locations. East River plots were 5 feet wide and either 12 or 14 feet long;West River plots measured 5 feet wide by 25 feet long. Plots consisted of drill strips with 7- or 8-inch spacing at East River locations and 10-inch spacing at West River locations. Trial locations are listed in Table B. Yield means are generated from four variety replications per location per year.

Fertility and weed control programs differed between East and West River locations. East River plots were fertilized with 60 lb/ac of 18-46-0 (10.8 lb N and 27.6 lb P per acre) down the seed tube at seeding. At Brown County a post-emergence application of Bronate (1 pint) was applied on all the small grain plots. West River plots were fertilized with 6 gal of 10-34-0 per acre (6.6 lb N and 24 lb P per acre) at seeding. Post-emergence applications of 0.5 oz. of Harmony GT (wheat) and 1 pint of Bronate (oats and barley) per acre were applied at the 3- to 5- leaf stage. In addition, .67 pint per acre of Puma was used to control wild oat at Ralph and Bison.

Since seed size can vary greatly among varieties, a seed count is conducted on each entry and all seeding rates are adjusted accordingly. At East River locations the adjusted seeding rates are 28 pure live seeds per square foot; at West River locations rates are 22 pure live seeds per square foot. Under good seedbed preparation and favorable conditions these adjusted seeding rates result in seedling densities of about 25 and 20 plants per square foot at the East and West River locations, respectively. This results in a final stand of about 1.1 million and 870,000 plants per acre, respectively. If you have a poor seedbed, increase the spring grain seeding rate to 32 and 25 seeds per square foot at East and West River locations, respectively. If planting is delayed until May 1 or later, increase the seeding rates to 35 and 28 seeds per square foot at East and West River locations, respectively. Seeding dates are listed in Table B.

Performance trial highlights

HRS Wheat (Tables 1a – 1c). The top performing varieties for year 2003 (variety and top yield percentage) were **Alsen and Forge at 63%**, **Reeder and Russ at 50%**, and **Briggs, Oxen, and Walworth at 38%** (see agronomic performance tables for spring wheat). This means these varieties were in the top-yielding group at 63%, 50%, and 38% of the test locations for 2003. The best top-yield varieties over the past three years were **Forge, Reeder, and Russ at 100%**; **Oxen, Knudson, and Parshall at 83%**; and **Alsen, Briggs, Ingot, NorPro and Walworth at 67%** of the test locations. **Ingot** has consistently exhibited the highest statewide bushel weight in the SDSU-CPT trials for the last few years.

Oat (Tables 2a – 2c). In 2003, **Don, HiFi, and Jerry** exhibited a top yield percentage of **50%**. Over the past

3 years the highest top yield percentages were **Jerry at 80%; and Don, Loyal, and Reeves at 60%**.

NOTE: This year the hull-less varieties Buff and Paul exhibited the highest average bushel weights (43 and 42 lb, respectively) followed by the conventional varieties Hytest, Jerry, and Reeves (40, 38, and 38 lb, respectively).

Barley (Tables 3a – 3c). In 2003, the best top yield group percentages were **Haxby at 75%; Valier at 63%, and Conlon** and **Excel at 38%** of the locations tested. The better varieties over the past three years were **Lacey at 100%; Robust at 80%,** and **Conlon, Drummond, and Excel at 60%** of the test locations. The two-row varieties, Haxby and Conlon, tested 1 to 3 lb higher in bushel weight than the average across all varieties.

HRW Wheat (Tables 4a – 4c). In 2003, the better performing varieties were **Jagalene, Millennium, and Wahoo; followed by the varieties CDC Falcon, Expedition, Wesley, Alliance, and Arapahoe** that performed above average. The best varieties for the past 3 years were **Alliance, Arapahoe, CDC Falcon, Expedition, Millennium, Nekota, Tandem, Trego (white), Wahoo, and Wesley**. Limited subsoil moisture and a lack of timely seasonal moisture were major factors in some winter wheat production areas of South Dakota again this year.

Note the coleoptile length of the various varieties included in the agronomic performance table. The coleoptile length of 3.2 inches for Harding is used as the standard (100%) for making comparisons. The coleoptile length for the varieties Crimson, Ransom, and Tandem are slightly longer than for Harding; the coleoptile length for the varieties Alliance, NuPlains, Millennium, Trego, and Wesley are shorter compared to Harding.

The people who put this report together

The Variety Release/Recommendation Committee includes plant breeders, pathologists, research scientists, Extension agronomists, and managers of the Seed Certification Service and Foundation Seed Stocks Division.
